CS6301 MACHINE LEARNING MINI PROJECT

Comparing Collaborative Filtering and Hybrid based Approaches for Movie Recommendation

<u>TEAM MEMBERS</u>

ASHWIN MENON - 2019103510

CONTENTS

INTRODUCTION

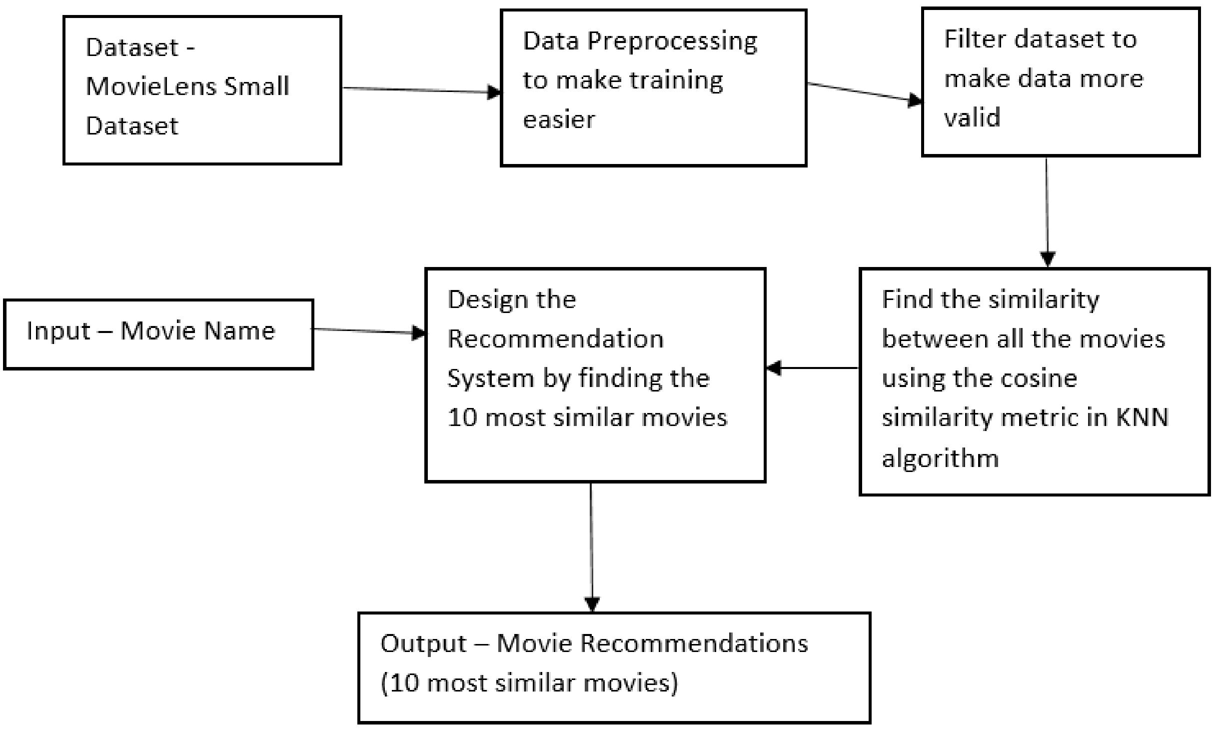
The main aim of the mini project is to create a movie recommender system using collaborative filtering and hybrid based approaches. Movies are something which we all see to relax and entertain ourselves and finding a similar movie to the one you like will be very much useful and helpful. The objective of automating the movie recommender is to make the selection of which movie to see next quick and less cumbersome for the user. We are using 2 different methods to do the same, they are

Collaborative Filtering - Where we take the user's ratings for each movie and try to find the similarity between them using the cosine metric.

Hybrid Based Approach - Where we first find the weightage of each genre within a movie and then take the user's ratings and combine both the information to find the similarity between movies

COLLABORATIVE FILTERING

BLOCK DIAGRAM FOR COLLABORATIVE FILTERING



LIST OF MODULES FOR COLLABORATIVE FILTERING

MODULE 1 : IMPORTING DATA

First, we import libraries which we'll be using in our movie recommendation system and then import the 2 datasets we require in our system. The 2 datasets are rating dataset and movies dataset from the Movielens small dataset (Source : https://www.kaggle.com/shubhammehta21/movie-lens-small-latest-dataset)

Movie dataset has the following fields:

1)movieId – once the recommendation is done, we get a list of all similar movieId and get the title for each movie from this dataset.

2)genres – which is not required for this filtering approach.

While Ratings dataset has the following fields:

1) userId - unique for each user
2) movieId - using this feature, we take the title of the movie from the movies dataset.
3) rating - Ratings given by each user to all the movies using this we are going to predict the top 10 similar movies.

CODE IMPLEMENTATION

```python
import pandas as pd
import numpy as np
from scipy.sparse import csr_matrix
from sklearn.neighbors import NearestNeighbors
import matplotlib.pyplot as plt
import seaborn as sns

# Dataset Source : https://www.kaggle.com/shubhammehta21/movie-lens-small-latest-dataset
movies = pd.read_csv("movies.csv")
ratings = pd.read_csv("ratings.csv")
```

```python
movies.head()
```

	movieId	title	genres
0	1	Toy Story (1995)	Adventure|Animation|Children|Comedy|Fantasy
1	2	Jumanji (1995)	Adventure|Children|Fantasy
2	3	Grumpier Old Men (1995)	Comedy|Romance
3	4	Waiting to Exhale (1995)	Comedy|Drama|Romance
4	5	Father of the Bride Part II (1995)	Comedy

```python
ratings.head()
```

	userId	movieId	rating	timestamp
0	1	1	4.0	964982703
1	1	3	4.0	964981247
2	1	6	4.0	964982224
3	1	47	5.0	964983815
4	1	50	5.0	964982931

MODULE 2 : DATA PRE-PROCESSING

To make things easier to understand and work with, we are going to make a new dataframe where each column would represent each unique userId and each row represents each unique movieId. We can see that some users have not rated movies hence the Nan value present in the dataset. We can replace this Nan value with 0 to make the computing more easier.

CODE IMPLEMENTATION

```
final_dataset = ratings.pivot(index='movieId',columns='userId',values='rating')
final_dataset.head()
```

userId movieId	1	2	3	4	5	6	7	8	9	10	...	601	602	603	604	605	606	607	608	609	610
1	4.0	NaN	NaN	NaN	4.0	NaN	4.5	NaN	NaN	NaN	...	4.0	NaN	4.0	3.0	4.0	2.5	4.0	2.5	3.0	5.0
2	NaN	NaN	NaN	NaN	NaN	4.0	NaN	4.0	NaN	NaN	...	NaN	4.0	NaN	5.0	3.5	NaN	NaN	2.0	NaN	NaN
3	4.0	NaN	NaN	NaN	NaN	5.0	NaN	NaN	NaN	NaN	...	NaN	NaN	NaN	NaN	NaN	NaN	NaN	2.0	NaN	NaN
4	NaN	NaN	NaN	NaN	NaN	3.0	NaN	NaN	NaN	NaN	...	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN
5	NaN	NaN	NaN	NaN	NaN	5.0	NaN	NaN	NaN	NaN	...	NaN	NaN	NaN	3.0	NaN	NaN	NaN	NaN	NaN	NaN

5 rows × 610 columns

```
final_dataset.fillna(0,inplace=True)
final_dataset.head()
```

userId movieId	1	2	3	4	5	6	7	8	9	10	...	601	602	603	604	605	606	607	608	609	610
1	4.0	0.0	0.0	0.0	4.0	0.0	4.5	0.0	0.0	0.0	...	4.0	0.0	4.0	3.0	4.0	2.5	4.0	2.5	3.0	5.0
2	0.0	0.0	0.0	0.0	0.0	4.0	0.0	4.0	0.0	0.0	...	0.0	4.0	0.0	5.0	3.5	0.0	0.0	2.0	0.0	0.0
3	4.0	0.0	0.0	0.0	0.0	5.0	0.0	0.0	0.0	0.0	...	0.0	0.0	0.0	0.0	0.0	0.0	0.0	2.0	0.0	0.0
4	0.0	0.0	0.0	0.0	0.0	3.0	0.0	0.0	0.0	0.0	...	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
5	0.0	0.0	0.0	0.0	0.0	5.0	0.0	0.0	0.0	0.0	...	0.0	0.0	0.0	3.0	0.0	0.0	0.0	0.0	0.0	0.0

5 rows × 610 columns

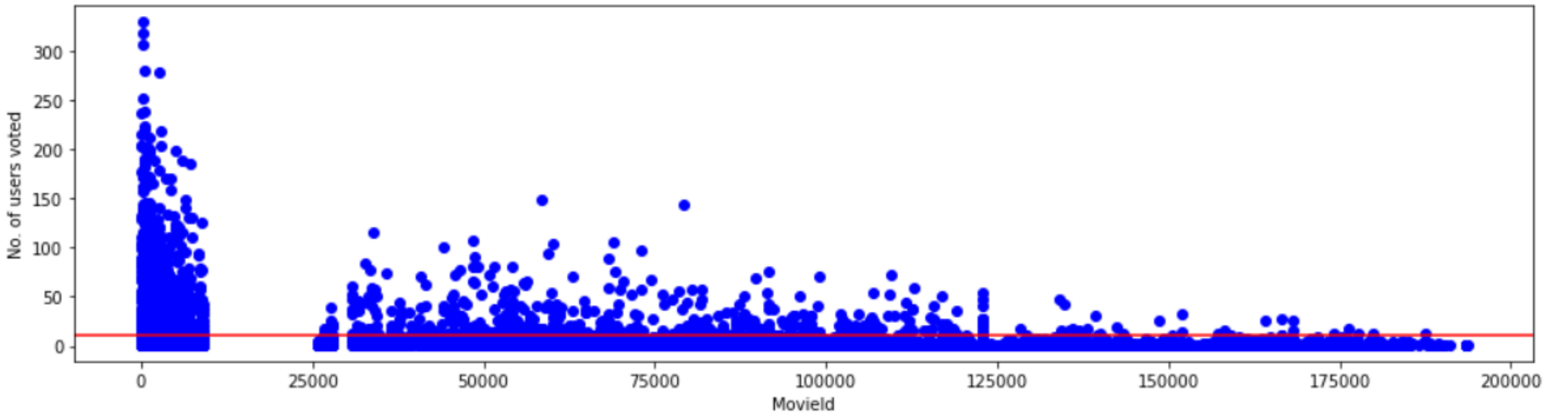
MODULE 3 : NOISE REMOVAL FROM DATA

We wouldn’t want movies that were rated by a small number of users because it’s not credible enough. Similarly, users who have rated only a handful of movies should also not be taken into account. So with all that taken into account and some trial and error experimentations, we will reduce the noise by adding some filters for the final dataset. To qualify a movie, a minimum of 10 users should have voted a movie. To qualify a user, a minimum of 50 movies should have voted by the user. To do so we aggregate the number of users who voted and the number of movies that were voted and apply the above filters. We can visualize this number of users voted and also the movies which got rated.

CODE IMPLEMENTATION

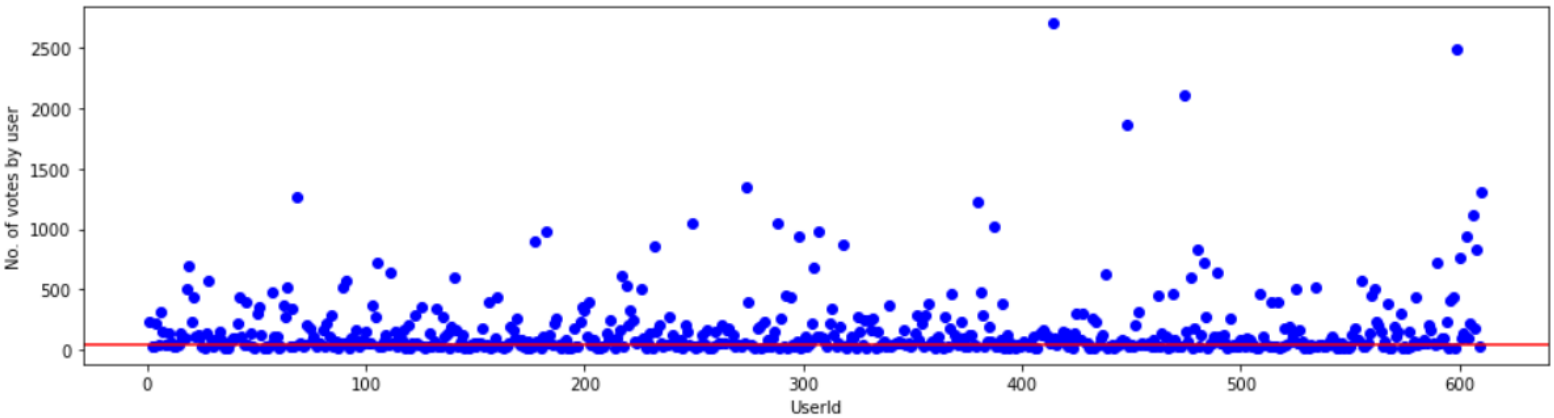
```
no_user_voted = ratings.groupby('movieId')['rating'].agg('count')
no_movies_voted = ratings.groupby('userId')['rating'].agg('count')
```

```
f,ax = plt.subplots(1,1,figsize=(16,4))
plt.scatter(no_user_voted.index,no_user_voted,color='blue')
plt.axhline(y=10,color='r')
plt.xlabel('MovieId')
plt.ylabel('No. of users voted')
plt.show()
```



```
final_dataset = final_dataset.loc[no_user_voted[no_user_voted > 10].index,:]
```

```
f,ax = plt.subplots(1,1,figsize=(16,4))
plt.scatter(no_movies_voted.index,no_movies_voted,color='blue')
plt.axhline(y=50,color='r')
plt.xlabel('UserId')
plt.ylabel('No. of votes by user')
plt.show()
```



```
final_dataset=final_dataset.loc[:,no_movies_voted[no_movies_voted > 50].index]
```

MODULE 4 : SPARSITY REMOVAL

Our system may run out of computational resources when the large dataset is feed to the model. To reduce the sparsity we use the csr_matrix function from the scipy library.

CODE IMPLEMENTATION

```
csr_data = csr_matrix(final_dataset.values)
final_dataset.reset_index(inplace=True)
```

MODULE 5 : DESIGNING THE MODEL

We will be using the KNN algorithm to compute similarity with cosine distance metric which is very fast and more preferable than pearson coefficient. We first check if the movie name input is in the database and if it is we use our recommendation system to find similar movies and sort them based on their similarity distance and output only the top 10 movies with their distances from the input movie.

CODE IMPLEMENTATION

```
knn = NearestNeighbors(metric='cosine', algorithm='brute', n_neighbors=20, n_jobs=-1)
knn.fit(csr_data)
```

```
NearestNeighbors(algorithm='brute', metric='cosine', n_jobs=-1, n_neighbors=20)
```

```
def get_movie_recommendation(movie_name):
    n_movies_to_reccomend = 10
    movie_list = movies[movies['title'].str.contains(movie_name)]
    if len(movie_list):
        movie_idx= movie_list.iloc[0]['movieId']
        movie_idx = final_dataset[final_dataset['movieId'] == movie_idx].index[0]
        distances , indices =
        knn.kneighbors(csr_data[movie_idx],n_neighbors=n_movies_to_reccomend+1)
        rec_movie_indices = sorted(list(zip(indices.squeeze().tolist(),distances.squeeze().tolist())),key=lambda x: x[1])[:0:-1]
        recommend_frame = []
        for val in rec_movie_indices:
            movie_idx = final_dataset.iloc[val[0]]['movieId']
            idx = movies[movies['movieId'] == movie_idx].index
            recommend_frame.append({'Title':movies.iloc[idx]['title'].values[0],'Distance':val[1]})
        df = pd.DataFrame(recommend_frame,index=range(1,n_movies_to_reccomend+1))
        return df
    else:
        return "No movies found. Please check your input"
```

MODULE 6 : RECOMMEND SIMILAR MOVIES

Once the user enters the movie name the 10 most similar movies present in the dataset are displayed.

CODE IMPLEMENTATION

```
get_movie_recommendation('Memento')
```

	Title	Distance
1	American Beauty (1999)	0.389346
2	American History X (1998)	0.388615
3	Pulp Fiction (1994)	0.386235
4	Lord of the Rings: The Return of the King, The...	0.371622
5	Kill Bill: Vol. 1 (2003)	0.350167
6	Lord of the Rings: The Two Towers, The (2002)	0.348358
7	Eternal Sunshine of the Spotless Mind (2004)	0.346196
8	Matrix, The (1999)	0.326215
9	Lord of the Rings: The Fellowship of the Ring,...	0.316777
10	Fight Club (1999)	0.272380

```
get_movie_recommendation('Titanic')
```

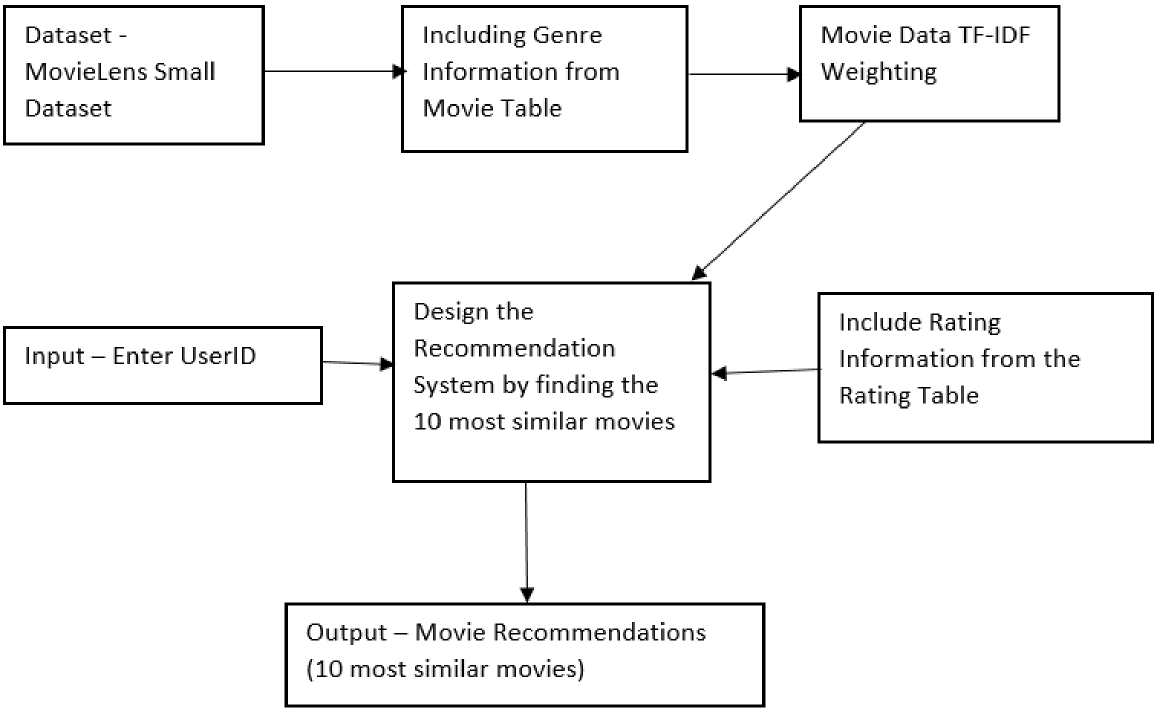
	Title	Distance
1	Good Will Hunting (1997)	0.460759
2	Truman Show, The (1998)	0.460628
3	Catch Me If You Can (2002)	0.460281
4	Sixth Sense, The (1999)	0.452878
5	Saving Private Ryan (1998)	0.437196
6	Shrek (2001)	0.433120
7	Finding Nemo (2003)	0.432400
8	Star Wars: Episode I - The Phantom Menace (1999)	0.427623
9	Forrest Gump (1994)	0.427187
10	Men in Black (a.k.a. MIB) (1997)	0.420254

```
get_movie_recommendation('Avatar')
```

	Title	Distance
1	Zombieland (2009)	0.398180
2	Inception (2010)	0.393521
3	I Am Legend (2007)	0.389856
4	Hangover, The (2009)	0.364190
5	Dark Knight, The (2008)	0.358937
6	Kung Fu Panda (2008)	0.358604
7	Iron Man (2008)	0.310893
8	District 9 (2009)	0.309947
9	WALL·E (2008)	0.306969
10	Up (2009)	0.289607

HYBRID BASED APPROACH

BLOCK DIAGRAM FOR HYBRID BASED APPROACH



LIST OF MODULES FOR HYBRID BASED APPROACH

MODULE 1 : IMPORTING DATA

First, we import libraries which we'll be using in our movie recommendation system and then import the 2 datasets we require in our system. The 2 datasets are rating dataset and movies dataset from the Movielens small dataset (Source : https://www.kaggle.com/shubhammehta21/movie-lens-small-latest-dataset)

Movie dataset has the following fields:

1)movieId – once the recommendation is done, we get a list of all similar movieId and get the title for each movie from this dataset.

2)genres – which is not required for this filtering approach.

While Ratings dataset has the following fields:

1)userId - unique for each user

2)movieId - using this feature, we take the title of the movie from the movies dataset.

3)rating - Ratings given by each user to all the movies using this we are going to predict the top 10 similar movies.

CODE IMPLEMENTATION

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt

# Dataset Source : https://www.kaggle.com/shubhammehta21/movie-lens-small-latest-dataset
movies = pd.read_csv("movies.csv")
ratings = pd.read_csv("ratings.csv")
movies = movies.replace({np.nan: None})

movie_initial = movies
```

```
movies.head()
```

	movieId	title	genres
0	1	Toy Story (1995)	Adventure|Animation|Children|Comedy|Fantasy
1	2	Jumanji (1995)	Adventure|Children|Fantasy
2	3	Grumpier Old Men (1995)	Comedy|Romance
3	4	Waiting to Exhale (1995)	Comedy|Drama|Romance
4	5	Father of the Bride Part II (1995)	Comedy

```
ratings.head()
```

	userId	movieId	rating	timestamp
0	1	1	4.0	964982703
1	1	3	4.0	964981247
2	1	6	4.0	964982224
3	1	47	5.0	964983815
4	1	50	5.0	964982931

MODULE 2 : INCLUDE GENRE INFORMATION

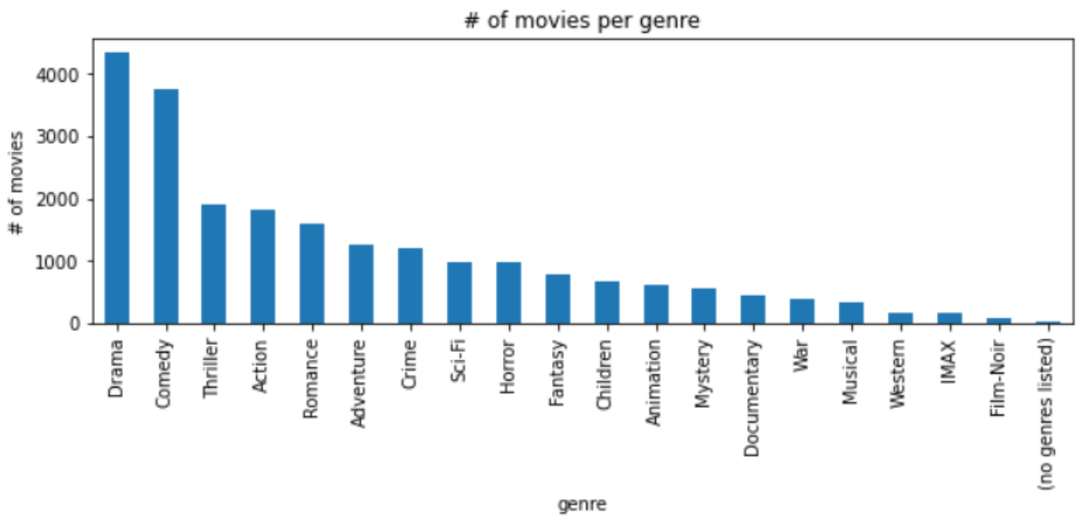
All the genres are present in the genres field inside movies dataset so we first find all the genres present in the dataset and visualize the count for each genre. Now we update the movies dataframe by adding all the genres as column headings and then iterate over all the movies and find the genres for each movie and mark only that field in the dataframe as 1. We now remove the title and genres column as they are no longer needed and then set the movieId as index and sort the data frame based on movieId.

CODE IMPLEMENTATION

```
all_genres = [s.split("|") for s in movies[movies.genres.notnull()].genres]
genres = [item for l in all_genres for item in l ]
unique_genres = set(genres)
print (f"total of {len(unique_genres)} unique genres from {len(genres)} occurances.")

pd.Series(genres).value_counts().plot(kind='bar', figsize=(10, 3))
plt.title("# of movies per genre")
plt.ylabel("# of movies")
plt.xlabel("genre")
plt.show()
```

```
total of 20 unique genres from 22084 occurances.
```



```python
genres = [item.strip() for l in all_genres for item in l ]
unique_genres = set(genres)
for genre in unique_genres:
    movies[genre] = 0
```

```python
for i in range(len(movies)):
    if type(movies['genres'].iloc[i]) != None.__class__:
        Genres = movies.iloc[i].genres.split('|')
        for g in Genres:
            movies[g].iloc[i] = 1

movies.head()
```

```python
movies = movies.drop(columns=['title', 'genres']).set_index('movieId')

movies.sort_index(axis=0, inplace=True)
movies.head()
```

movieId	Western	Children	Action	Animation	(no genres listed)	Thriller	Horror	Documentary	IMAX	Crime	Musical	Mystery	Romance	War	Sci-Fi	Fantasy	Film-Noi
1	0	1	0	1	0	0	0	0	0	0	0	0	0	0	0	1	0
2	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
3	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
4	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
5	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MODULE 3 : MOVIE DATA TF-IDF WEIGHTING

We first calculate the document frequency (df) the number of terms(in this case genres) within all movies and then calculate Inverse document frequency (IDF) which measures the importance of each term (in this case genre) within all movies and then print the calculated values.We now calculate the tf-idf value using the previous calculated values and print that.

CODE IMPLEMENTATION

```
df = movies.sum()
idf = (len(movies)/df).apply(np.log)

print("\nDocument Frequency : \n",df,"\n\nInverse Document Frequency : \n",idf,"\n")
```

```
Document Frequency :
 Western                167
Children               664
Action                1828
Animation              611
(no genres listed)      34
Thriller              1894

9742 rows × 20 columns

MODULE 4 : INCLUDE RATING INFORMATION

We are now going to make a new dataframe where each column would represent each unique userId and each row represents each unique movieId so that it is easier to visualize. We make all the missing values as 0. We are now going to calculate the user's preference of each genre in any movie using the user ratings for each movie from the ratings dataset.

CODE IMPLEMENTATION

```
user_x_movie = pd.pivot_table(ratings, values='rating', index=['movieId'], columns = ['userId'])
user_x_movie.sort_index(axis=0, inplace=True)

user_x_movie.fillna(0,inplace=True)
user_x_movie
```

userId	1	2	3	4	5	6	7	8	9	10	...	601	602	603	604	605	606	607	608	609	610
movieId																					
1	4.0	0.0	0.0	0.0	4.0	0.0	4.5	0.0	0.0	0.0	...	4.0	0.0	4.0	3.0	4.0	2.5	4.0	2.5	3.0	5.0
2	0.0	0.0	0.0	0.0	0.0	4.0	0.0	4.0	0.0	0.0	...	0.0	4.0	0.0	5.0	3.5	0.0	0.0	2.0	0.0	0.0

MODULE 5 : DESIGNING MOVIE RECOMMENDATION SYSTEM MODEL

We now calculate the sum product of the importance weights and users' preferences towards different genres. Based on the previous sum of products we suggest the users the top 10 candidates as recommendations. We first get the predicted rating of all films for the user, then we combine film rating and film detail. We then recommend the films only which has not been seen by the user.

CODE IMPLEMENTATION

```
df_predict = pd.DataFrame()

for i in tqdm(range(len(user_x_movie.columns))):
    working_df = TFIDF.mul(user_profile.iloc[i], axis=1)
    df_predict[user_x_movie.columns[i]] = working_df.sum(axis=1)
```

```
100%|████████████████████████████████████████| 610/610 [00:02<00:00, 263.53it/s]
```

```
df_predict
```

MODULE 6 : RECOMMEND SIMILAR MOVIES

Once the user enters the userID the 10 most similar movies present in the dataset are displayed.

CODE IMPLEMENTATION

```
recommender(600)
```

5665	27618	Sound of Thunder, A (2005)

PERFORMANCE METRICS

a) Accuracy
b) F1 Score
c) Recall
d) Precision

$$Accuracy = \frac{Number\ of\ Correct\ predictions}{Total\ number\ of\ predictions\ made}$$

$$F1 = 2 * \frac{1}{\frac{1}{precision} + \frac{1}{recall}}$$

F1 Score

$$Precision = \frac{TruePositives}{TruePositives + FalseNegatives}$$

Recall

$$Precision = \frac{TruePositives}{TruePositives + FalsePositives}$$

Precision

COMPARISON

When you are using collaborative filtering the system may recommend movies which other users have rated or watched similarly while you may not have any interest. For Example, a user would be suggested some genre which they may not like, because other audience who watched the same movies which the user had, watched that particular genre. So that is why we combine content based filtering and collaborative filtering so that even the user’s interests are acknowledged leading to a much better recommendation for a user
